## **Declaration**

I certify that this research work titled “*Machine vision based Facial Recognition system with Database Management System for Gate Access Control and Attendance System.*” is my own work. The work has not been presented elsewhere for assessment. The material that has been used from other sources it has been properly acknowledged / referred.

Signature of Student

IMRAN QAYYUM MUNDIAL

00000281288

## **Language Correctness Certificate**

This thesis has been read by an English expert and is free of typing, syntax, semantic, grammatical and spelling mistakes. Thesis is also according to the format given by the university.

Signature of Student

IMRAN QAYYUM MUNDIAL

00000281288

Signature of Supervisor

## **Copyright Statement**

- Copyright in text of this thesis rests with the student author. Copies (by any process) either in full, or of extracts, may be made only in accordance with instructions given by the author and lodged in the Library of NUST College of E&ME. Details may be obtained by the Librarian. This page must form part of any such copies made. Further copies (by any process) may not be made without the permission (in writing) of the author.
- The ownership of any intellectual property rights which may be described in this thesis is vested in NUST College of E&ME, subject to any prior agreement to the contrary, and may not be made available for use by third parties without the written permission of the College of E&ME, which will prescribe the terms and conditions of any such agreement.

## **Acknowledgements**

I am thankful to my Creator **ALLAH SUBHANA-WATALA** to have guided me throughout this work at every step and for every new thought which **YOU** setup in my mind to improve it. Indeed, I could have done nothing without **YOUR** priceless help and guidance. Whosoever helped me throughout the course of my thesis, whether my parents or any other individual was **YOUR** will, so indeed none be worthy of praise but **YOU**.

I am profusely thankful to my beloved parents who raised me when I was not capable of walking and continued to support me throughout in every department of my life.

I would also like to express special thanks to my supervisor Dr. Mohsin Islam Tiwana for his help throughout my thesis. I can safely say that I haven't learned any other engineering subject in such depth than the ones which he has taught.

I would also like to pay special thanks to Dr. Umar Shahbaz Khan and Mr. M. Sohaib Ul Hassan for their tremendous support and cooperation. Each time I got stuck in something, they came up with the solution. Without their help I wouldn't have been able to complete my thesis. I appreciate their patience and guidance throughout the whole thesis.

I would also like to thank Dr. Amir Hamza and Dr. Waqar Shahid Qureshi for being on my thesis guidance and evaluation committee and their kind guidance through every step of my thesis and degree.

Finally, I would like to express my gratitude to all the individuals who have rendered valuable assistance to my study.

*Dedicated to my exceptional parents, beloved spouse and sweet daughter, Emaan. Whose tremendous support and cooperation led me to this wonderful accomplishment*

## **Abstract**

During the last two decades' security of men and materials remains a vital concern in the whole world. In particular, Pakistan being a victim of multiple terrorist attacks on military and civil setups suffered massive damage. To encounter a security threat, a lot of efforts have been done to improve the organization's security and various enhanced safety checks were incorporated. Moreover, with the emergence of novel coronavirus pandemic, face masks have become an important part of daily routine life. Nearly every organization in the world has adopted face masks as a primary precautionary measure to secure their workplaces. Masked faces have made existing technology ineffective in several scenarios, such as facial recognition access control and facial security checks at public places. This presents a new challenge to any organization's security. Since timely identification of masked faces is vital for an organization. For any setup to ensure right entry at the gate with an automated system for human face recognition (even with mask) in a real-time background is the latest requirement. A face recognition system is an application of computer vision that can perform two tasks identifying and verifying a person from a given database, intending to reduce the manual efforts of the management and security staff. This research thus focuses on implementing a face recognition system (even with a face mask) by using a machine vision-based approach. A dataset of masked faces was collected to train the Support Vector Machine classifier on state-of-the-art Facial Recognition Feature Extractor Convolution Neural Network. Proposed Methodology gives recognition accuracy of 98% with masked faces, and results in an effective gate access control and attendance system.

# Table of Contents

<b>Declaration</b> .....	iii
<b>Language Correctness Certificate</b> .....	iv
<b>Copyright Statement</b> .....	v
