ACKNOWLEDGEMENTS

All praises to Almighty Allah, the Creator and Sustainer of the universe, who is the origin of all knowledge and wisdom. Without His will nothing could happen. It is He who enabled me to successfully complete my research. All regards to Holy prophet Hazrat Muhammad (SAW) who paved us to the right path with the essence of faith in Allah. He is forever an ivory tower for all of us.

Acknowledgments for me are not merely a formality, rather an emotional association, which I have with the people who have helped me to achieve this goal. Therefore I am grateful and sincerely thankful to the precious and irreproachable supervision of my esteemed teacher **Dr. Saadia Andleeb**, Assistant Professor, Atta ur Rehman School of Applied Biosciences, National University of Sciences & Technology, Islamabad. It was her much concern and considerate guidance which guided me in the right direction throughout the course of my research work. I am particularly thankful to **Prof. Dr. Muhammad Ashraf**, Principal of Atta ur Rehman School of Applied Biosciences, National University of Sciences & Technology, Islamabad and the university itself for providing all the possible facilities to carry out this research work.

I also feel great pleasure to take this opportunity to express my regards and appreciation to respected **Dr. Taimoor Ashiq**, Atta ur Rehman School of Applied Biosciences National University of Sciences & Technology, Islamabad, for his help in sampling and guidance for the project.

I forward my thanks to my all seniors especially **Muhammad Faheem, Abida, Fakhira, Amna salman, Muhammad Ibrahim, Muhammad Bilal, Habiba Rasheed, Rubina, Madiha, Shabeena** and **Sidra**. They all had procured me their prodigious wits in my laboratory work.

I am also thankful to all my class fellows and friends especially **Nida ul Fatima, Rabia Shakeel, Aqsa Khurshid, Anam Farhan, Miriam Kathleen Gomez, Umer Javed, Talha Shafi, Umer Saeed, Zahra Zahid, Sanila Amber, Madiha Rashid, Talha Bin Rahat** and **Ahmed Zulfiqar** for providing me

Acknowledgements

refreshing society, cheerful company, sincere suggestions and cooperation. Also I would like to thank my juniors **Samina Urooj, Nazia Chaudary, Sannia Arif, Nayaab Nawaz, Hafsa Waheed, Hafsa Akhtar, Haleema Bhatti, Fizza Akhtar Butt, Sara Chaudary** and **Misbah Nazir** for their help and cooperation.

I would also like to express my regards and sincere thanks to all my teachers, especially **Dr. Ishtiaq Qadri, Dr. Hajra Sadia, Dr. Muhammad Tahir, Dr. Sadaf Zaidi, Dr. Peter John, Dr. Attya Bhatti, Sir Waqas Nasir Choudary, Sir Tahir A Baig, Madam Sadia Tahir** and **Dr. Faraz** for their supporting behavior, guidance and invaluable suggestions. I pay my special thanks to the staff of Atta ur Rehman School of Applied Biosciences especially Muhammad Amir and Fozia for the technical assistance.

Man has the power to speak and write to express his feelings but there are some relationships where words always fall short. I feel no way to convey my gratitude to decorous father and loving mother whom I owe all that I've ever had in my life, my brothers , my grandparents and my whole family for their moral support, which gave me the confidence and courage to fight problems and reach this stage. It is due to their prayers that I have completed my research work.

RABIA

ABSTRACT

Hepatitis E virus (HEV) infection is endemic in developing countries including Pakistan and it leads to fulminant hepatic failure (FHF) and high mortality in pregnant women. An altered status of hormones and immunity are observed during pregnancy but the actual cause of high mortality is still unknown. The present study was carried out to assay progesterone levels in the HEV IgG sero-positive pregnant women population of low socioeconomic status.

Total 91 pregnant females from Rawalpindi district were recruited for the study. Serological tests for IgG and IgM against HEV were performed using ELISA kits. Hormone assay was performed on all samples by commercially available RIA kit. Out of 91 patients, 54 were found positive for the IgG and 9 were found positive for IgM presence. Alteration of levels of progesterone from normal level was observed in all the trimesters of pregnancy. High levels of progesterone were observed during the first trimester and extreme low levels were observed during the 2nd and 3rd trimester. Levels of progesterone were found to be higher ($P < 0.001$) in HEV IgM positive pregnant patients when compared to HEV IgG positive patients.

It can be attributed from the study that presence of HEV-IgG and HEV-IgM appears to be associated with altered levels of progesterone in women of low socioeconomic status. Poor nutritional and environmental conditions are potential risk factor associated with alterations in the normal hormonal level observed in pregnancy. These alterations may serve as a reason for high mortality rate seen in HEV positive pregnant females.
